

1 / Orchestration and configuration

Each card lists every function defined in that script. Arrows identify main calls and outputs; helper calls are grouped to keep the drawing readable.

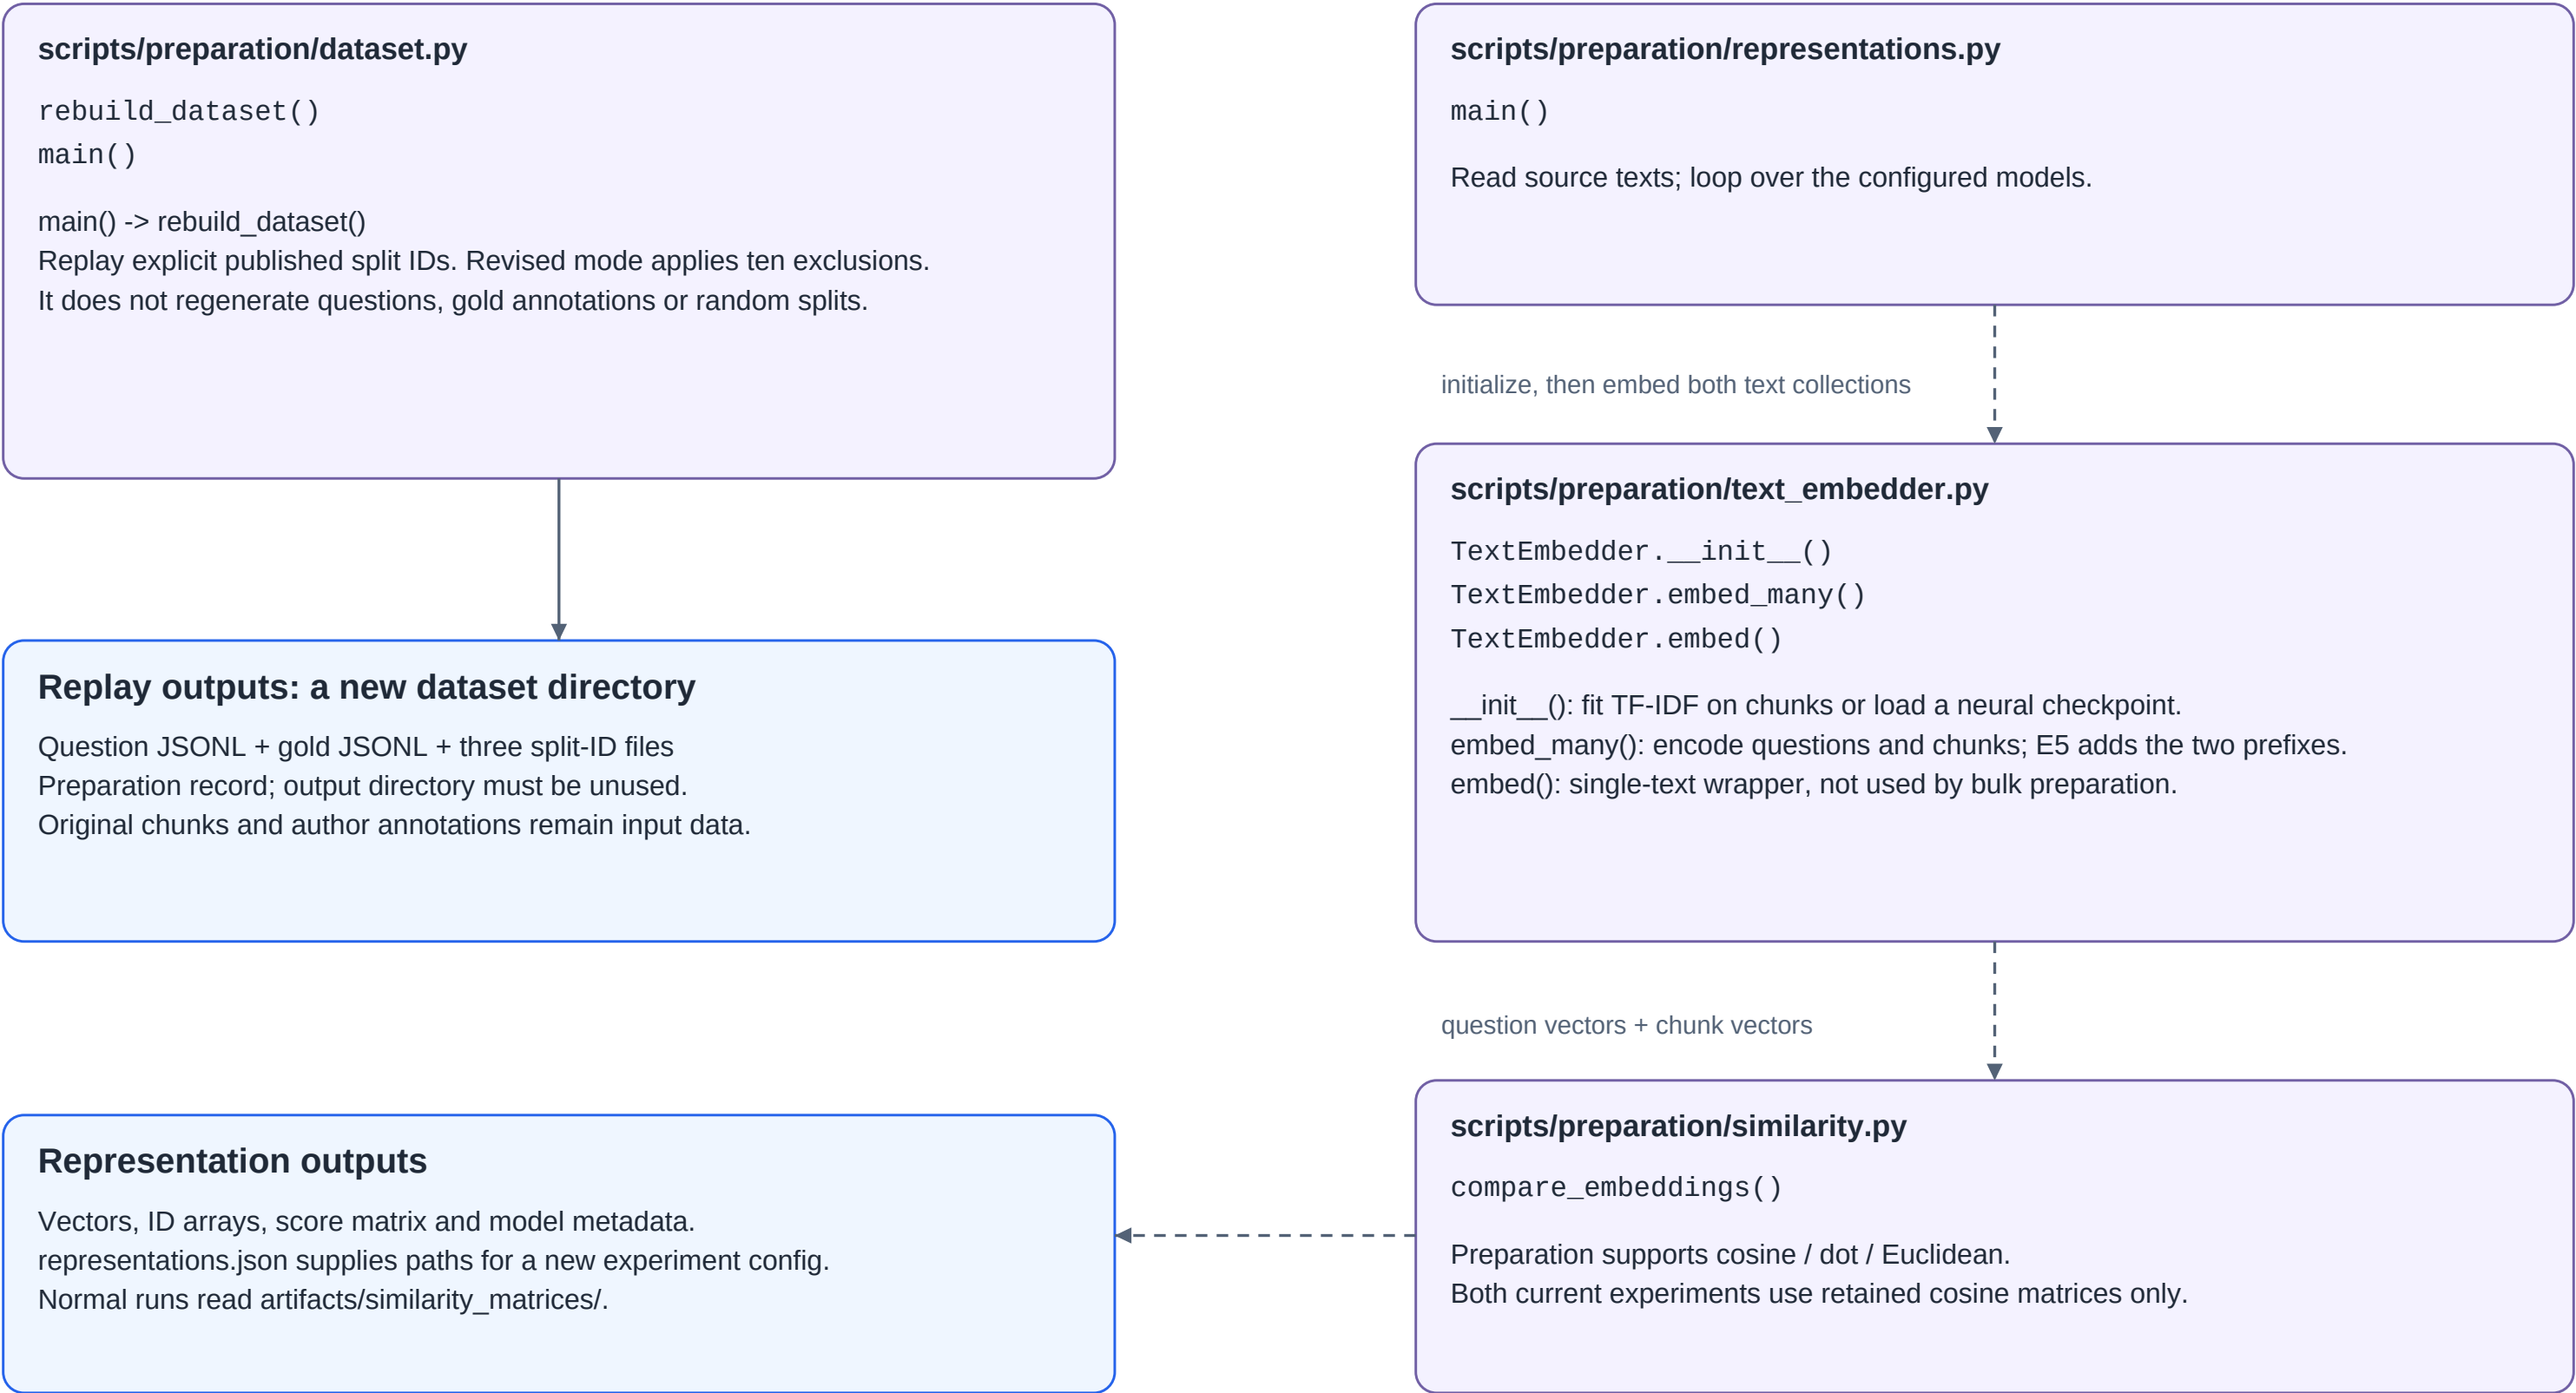

2 / Development search and evidence scoring

Search uses development only. The same selector and evaluator are used for coarse runs, fine runs, validation and test.

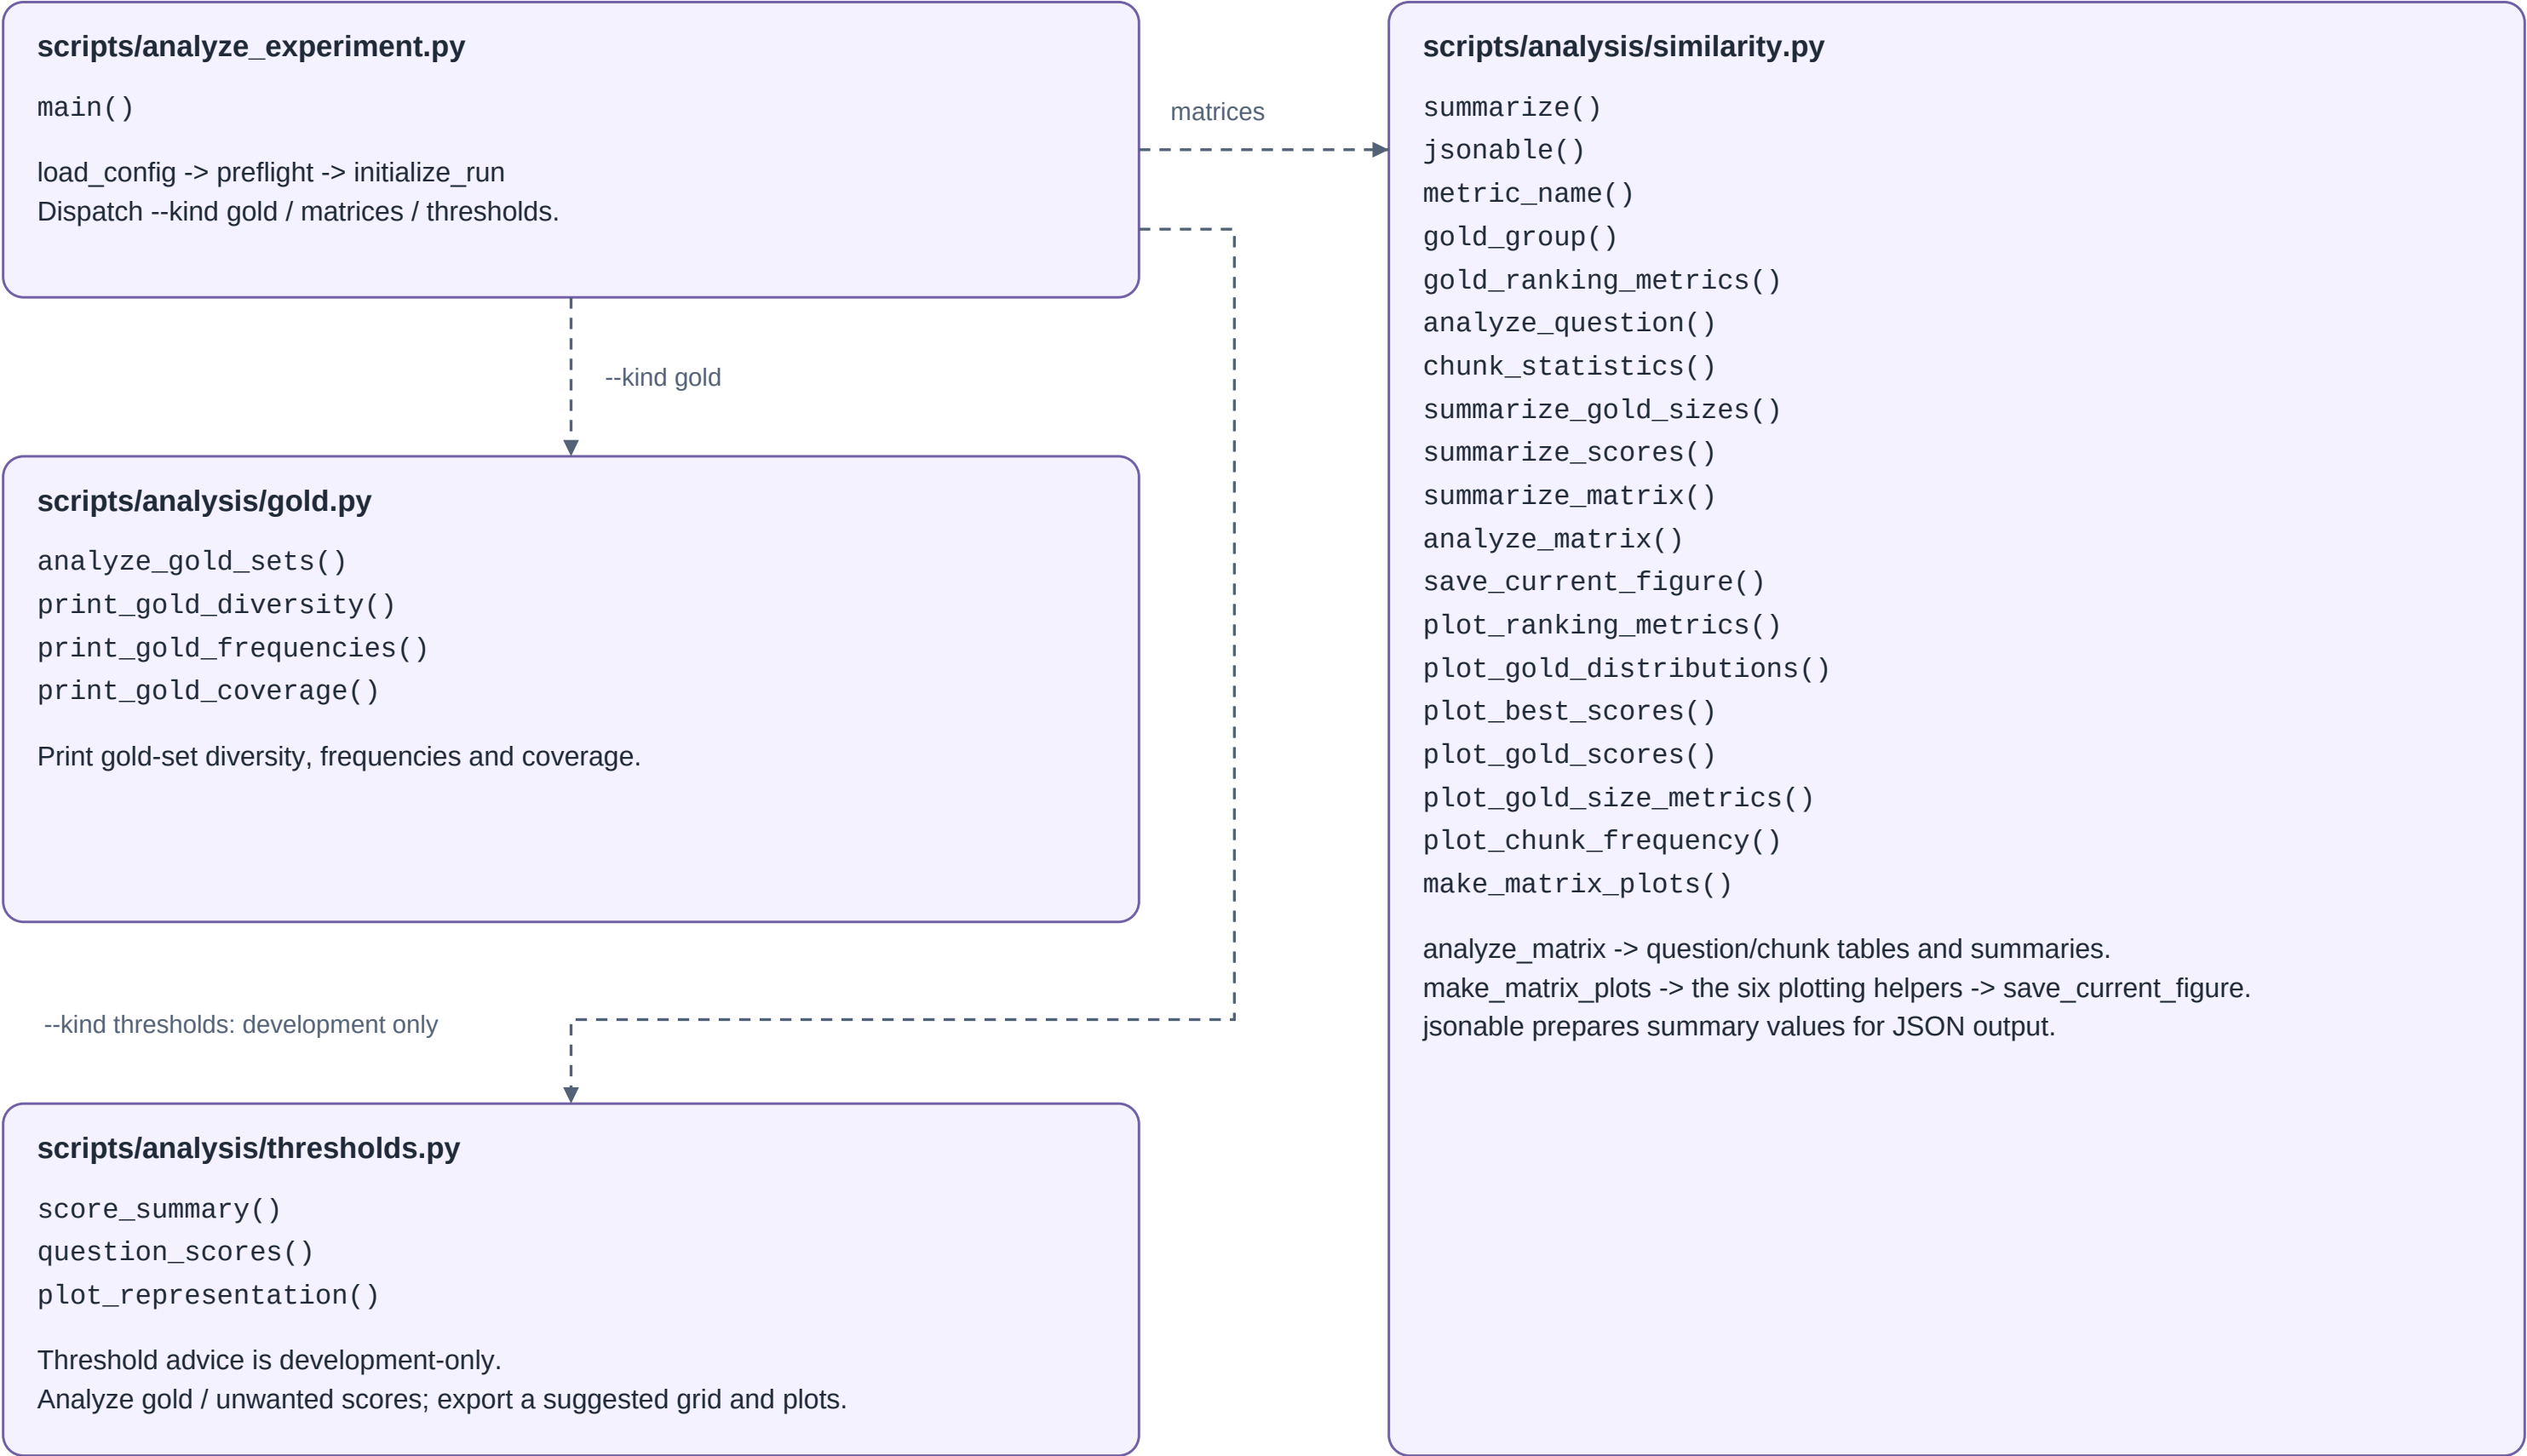

3 / Optional dataset and representation preparation

These are separate entry points. `scripts.run_experiment` does not call them during normal cached-matrix reruns.

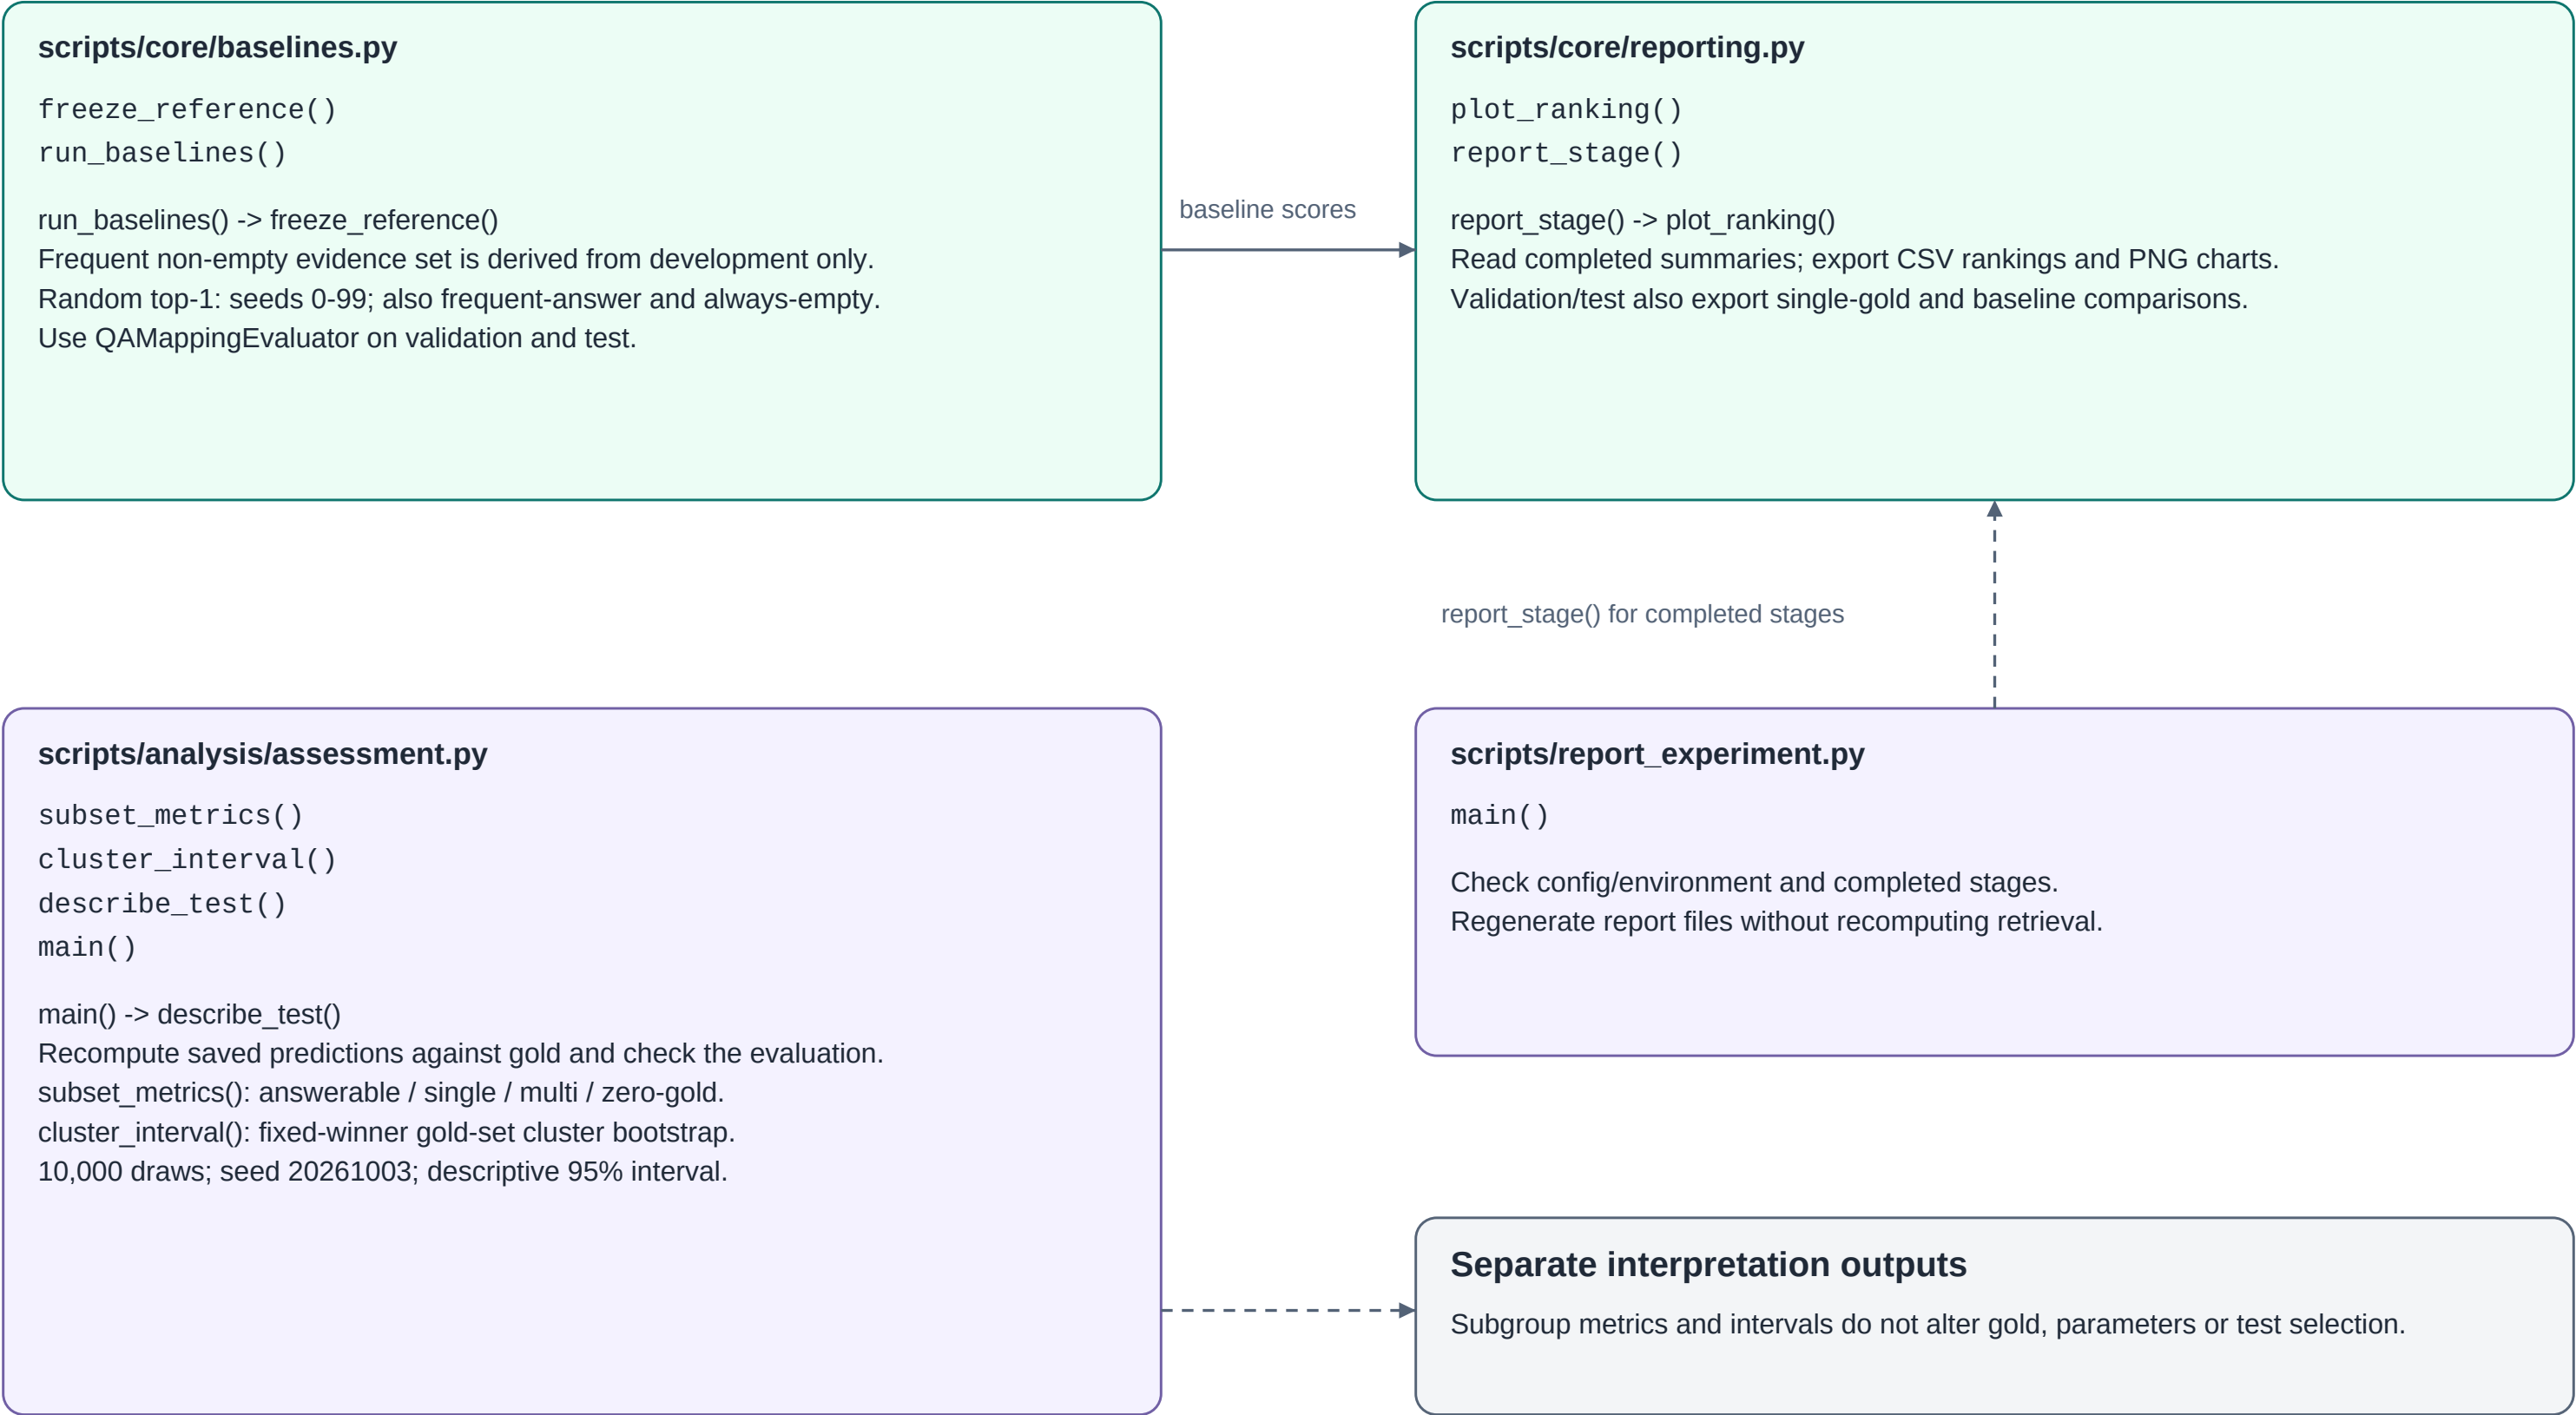

4 / Optional diagnostics

analyze_experiment.main() chooses one diagnostic branch. These exports do not tune or replace the selected experiment winner.

5 / Baselines, reports and descriptive test exports

Baselines and reports run automatically when enabled. Assessment is a separate read-and-export command; it does not choose a new model.

6 / Optional manual error review

Review labels describe saved outputs. They do not modify the experiment gold or its frozen winner. The AI-generated browser is auxiliary.
